2

Pattern

A reusable **solution**
to a known **problem**
in a well defined **context**

...just one of the possible definitions

3

3

Pattern

- Context
 - ♦ A (design) situation giving rise to a (design) problem
 - Problem
 - ♦ Set of forces repeatedly arising in the context
 - Force: any relevant aspect of the problem (Eg. requirements, constraints, desirable properties)
 - Solution
 - ♦ A proven resolution of the problem
 - ♦ Configuration to balance forces
 - Structure with components and relationships
 - Run-time behaviour
-

4

4

Example

SOCIAL
PATTERN

- Context:
 - ♦ At the supermarket several customers crowd the gastronomy desk to get their fresh cut of ham
- Problem:
 - ♦ Customers quarrel to have their turn first
 - ♦ Order of arrival should be obeyed
 - ♦ It is hard to spot who arrived earlier or later
- Solution:
 - ♦ Provide numbered tickets the customer take as soon as they arrive and which they are called by

5

5

History

- Initially proposed by Chrisopher Alexander
- He described patterns for architecture (of buildings)
 - ♦ *The pattern is, in short, at the same time a thing, which happens in the world, and the rule which tells us how to create that thing and when we create it. It is both a process and a thing ...*

6

6

Types of Pattern

- Architectural Patterns
 - ♦ Address system wide structures
 - Design Patterns
 - ♦ Leverage higher level mechanisms
 - Idioms
 - ♦ Leverage language specific features
-

7

7

Architectural pattern

- Expresses a fundamental structural organization schema for software systems
 - Provides a set of predefined components with their responsibilities
 - Defines the rules and guidelines for organizing the relationships between the components
-

8

8

Example

ARCHITECTURAL PATTERN

- Context:
 - ♦ several programs that are used in sequence read from input and write sequentially to output
- Problem:
 - ♦ there are a lot of intermediate files used for communication between programs
- Solution:
 - ♦ adopt a pipe & filter architecture feeding a program with the result of the previous one

9

9

Design pattern

- Provides a scheme for refining components of a software system or their relationships
- Describes a commonly recurring structure of communicating components

10

10

Example

DESIGN
PATTERN

- Context:
 - ♦ A class library providing few functionalities contains a lot of classes
- Problem:
 - ♦ The user is exposed to the internal complexity of the library
- Solution:
 - ♦ Create a new **façade** class that interacts with the user and hide all the details

11

11

Idiom

- Is a low-level pattern specific to a programming language
- Describes how to implement particular aspects of components or the relationships between them
- Leverages the features of a programming language

12

12

Example

IDIOM

- Context:
 - ♦ An attribute is constant and should be globally available to many classes
- Problem:
 - ♦ Opening access would allow unauthorized modifications
 - ♦ The attribute is repeated in every object
- Solution:
 - ♦ Make it `public static final`

13

13

Pattern Description

- Name
- Problem
- Context
- Forces
- Solution
- Force Resolution
- Design Rationale

Coplien

- Name
- Intent
- Motivation
- Applicability
- Structure
- Participants
- Collaborations
- Consequences
- Implementation
- Related Patterns

GoF

14

14

Pattern language

- Pattern do not exist in isolation
 - ♦ Two or more patterns are applied together
 - ♦ A pattern is used to implement part of another pattern
 - ♦ A pattern can introduce a problem solved by another
- We have Pattern Languages
 - ♦ Or pattern systems

15

15

Pattern Language

- Collection of patterns together with guidelines for
 - ♦ Implementation
 - ♦ Combination
 - ♦ Practical use
- Should
 - ♦ Count enough patterns
 - ♦ Describe patterns uniformly
 - ♦ Present relationships

16

16

Example

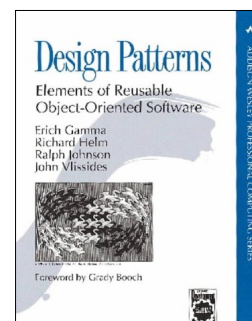

- MVC is implemented using
 - ♦ Observer
 - ♦ Iterator

17

17

Design Patterns (GoF)

- Describe the structure of components
- Most widespread category of pattern
- First category of patterns proposed for software development

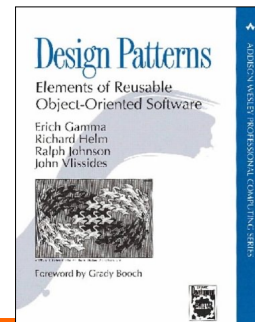

18

18

Design Patterns (GoF)

- Creational
 - ♦ E.g. Abstract Factory, Singleton
- Structural
 - ♦ E.g. Façade, Composite
- Behavioral
 - ♦ *Class*: e.g. Template Method
 - ♦ *Object*: e.g. Observer

19

19

Design patterns

- Description of communicating objects and classes that are customized to solve a general design problem in a particular context
- A design pattern names, abstracts, and identifies the key aspects of a common design structure that make it useful for creating a reusable object-oriented design

20

20

Description

- Name and classification
 - Intent
 - ♦ Also known as
 - Motivation
 - Applicability
 - Structure
 - Participants
 - Collaborations
 - Consequences
 - Implementation
 - Sample code
 - Known uses
 - Related patterns
-

21

21

Pattern classification

- Purpose
 - ♦ Creational
 - ♦ Structural
 - ♦ Behavioral
 - Scope
 - ♦ Class
 - ♦ Object
-

22

22

Pattern classification

		Purpose		
		Creational	Structural	Behavioral
Scope	Class	1	1	2
	Object	4	6	10

23

23

Pattern selection

- Consider how patterns solve problems
- Scan intent sections
- Study how pattern interrelate
- Study patterns of like purpose
- Examine a cause of redesign
- Consider what should be variable in your design

24

24

Using a pattern

- Read through the pattern
- Go back and study
 - ♦ Structure
 - ♦ Participants
 - ♦ Collaborations
- Look at the sample code

25

25

Using a pattern

- Choose names for participants
 - ♦ Meaningful in the application context
- Define the classes
- Choose operation names
 - ♦ Application specific
- Implement operations

26

26

Creational patterns

- Factory Method
- Abstract Factory
- Builder
- Prototype
- Singleton

27

27

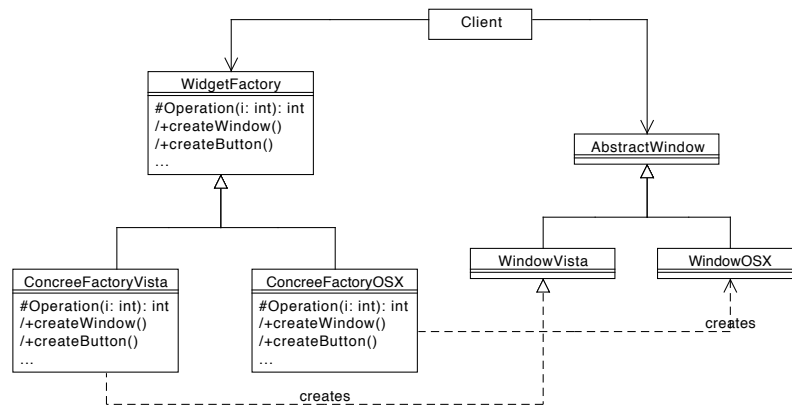

Abstract Factory

- Context
 - ♦ A family of related classes can have different implementation details
- Problem
 - ♦ The client should not know anything about which variant they are using / creating

28

28

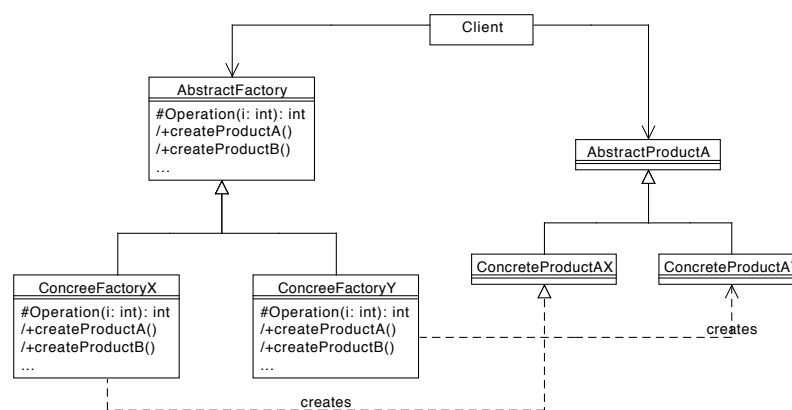

Abstract Factory Example

29

29

Abstract Factory

30

30

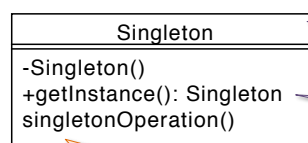

Singleton

- Context:
 - ♦ A class represents a concept that requires a single instance
- Problem:
 - ♦ Clients could use this class in an inappropriate way

31

31

Singleton Pattern

Singleton class

Instantiation
static method

```
private Singleton() { }
private static Singleton instance;
public static Singleton getInstance() {
    if(instance==null)
        instance = new Singleton();
    return instance;
}
```

32

32

Singleton Example

- `java.awt.Toolkit`
 - ♦ Singleton + FactoryMethod

java.awt::Toolkit
-Toolkit() +getDefaultToolkit(): Toolkit ...

33

33

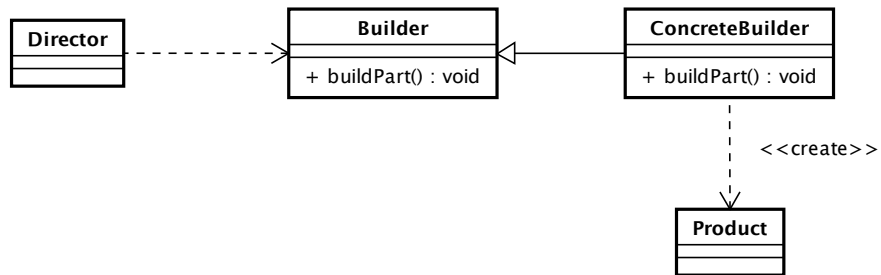

Builder object

- Context
 - ♦ An object of a complex class has to be created
- Problem
 - ♦ The creation entails complex interaction with the object
 - ♦ Different variation of the target object might be created

34

34

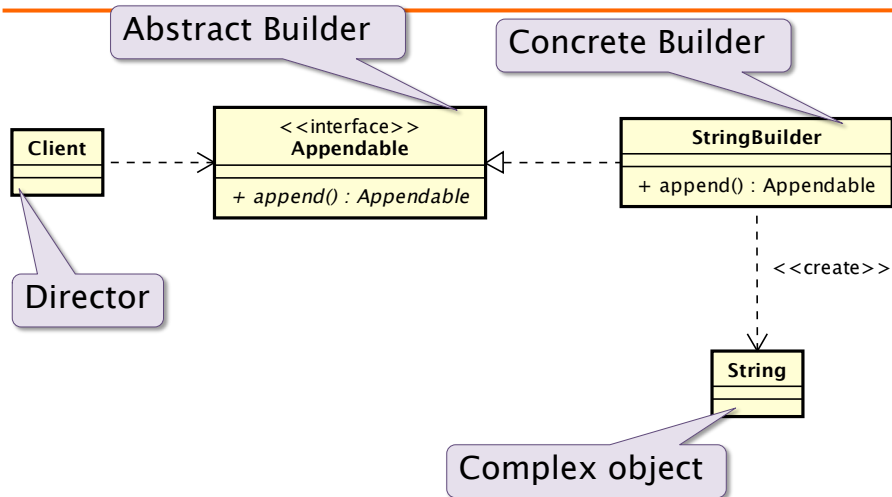

Builder Pattern

35

35

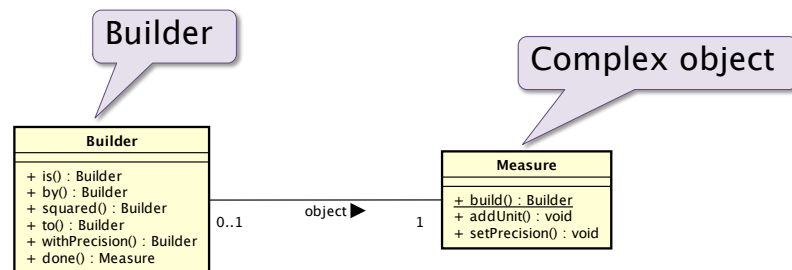

Builder example

36

36

Example Measure builder

Note: Simplified version w.r.t. GoF

37

37

Structural patterns

- Structural patterns are concerned with how classes and objects are composed to form larger structures.

38

38

GoF structural patterns

- Adapter
 - Bridge
 - Composite
 - Decorator
 - Facade
 - Flyweight
 - Proxy
-

39

39

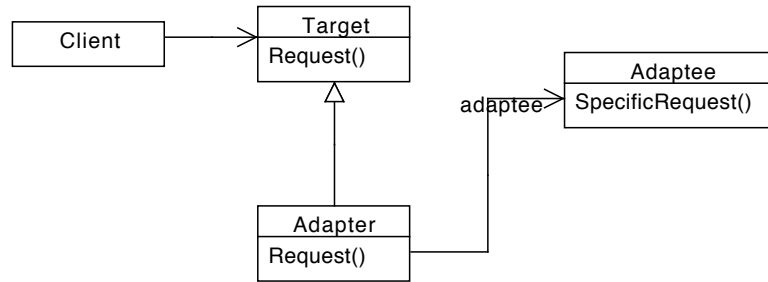

Adapter

- Context:
 - ♦ A class provides the features required by another class but its interface is not the one expected
 - Problem:
 - ♦ The integration of the provider class should be possible without modifying it
 - Its source code could be not available
 - It is already used as it is somewhere else
-

40

40

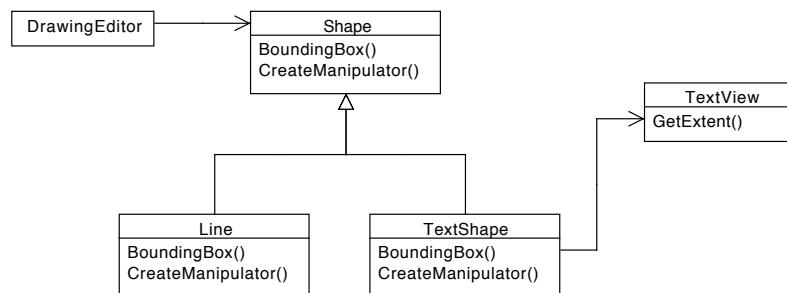

Adapter

41

41

Adapter example

42

42

Java Listener Adapter

- In Java GUI, events are handled by Listeners
- Listener classes need to implement Listener interfaces
 - ♦ Include several methods
 - ♦ They all should be implemented

43

43

Java Listener Adapter

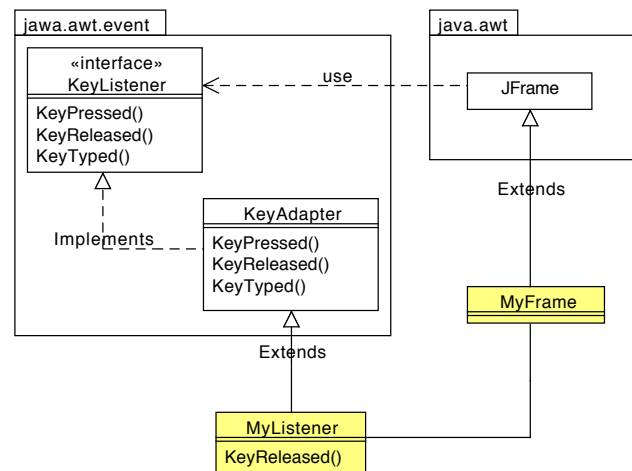

```
class MyListener{  
    public void KeyPressed(..){}  
    public void KeyReleased(..){  
        // ... handle event  
    }  
    public void KeyTyped(..){} }
```

```
class MyListener{  
    public void KeyReleased(..){  
        // ... handle event  
    }  
}
```

44

44

Java Listener Adapter

45

45

Structural Class Patterns

- Adapter pattern
 - ♦ Inheritance plays a fundamental role
 - ♦ Only example of structural class pattern

46

46

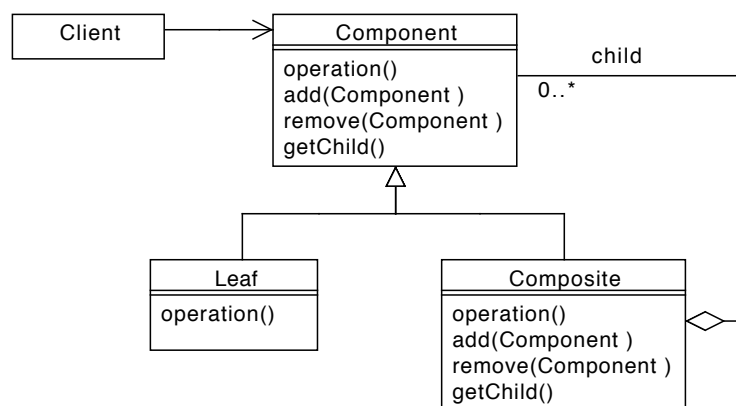

Composite

- Context:
 - ♦ You need to represent part-whole hierarchies of objects
- Problem
 - ♦ Clients are complex
 - ♦ Difference between composition objects and individual objects.

47

47

Composite

48

48

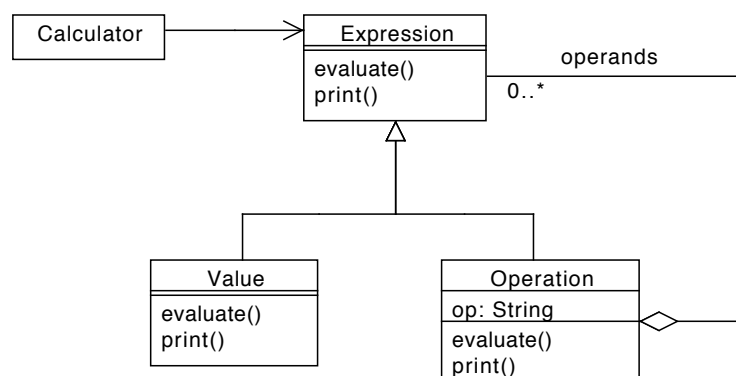

Composite Example

- Arithmetic expressions representation
 - ♦ Operators
 - ♦ Operands
- Evaluation of expressions

49

49

Composite Example

50

50

Composite Example

```
abstract class Expression {  
    public abstract int evaluate();  
    public abstract String print();  
}
```

51

51

Composite Example

```
class Value {  
    private int value;  
  
    public Value(int v) {  
        value = v;  
    }  
    public int evaluate() {  
        return value;  
    }  
    public String print() {  
        return new String(value);  
    }  
}
```

52

52

Composite Example

```
class Operation {  
    private char op; // +, -, *, /  
    private Expression left, right  
  
    public Operation(char op,  
        Expression l, Expression r){  
        this.op = op;  
        left = l;  
        right= r;  
    }  
    ...  
}
```

53

53

Composite Example

```
class Operation {  
    ...  
    public evaluate(){  
        switch(op){  
            case '+': return  
                left.evaluate() +  
                right.evaluate();  
            break;  
            ...  
        }  
    }  
    ...  
}
```

54

54

Composite Example

```
class Operation {  
    ...  
    public print() {  
        return left.print() + op +  
            right.print();  
    }  
}
```

55

55

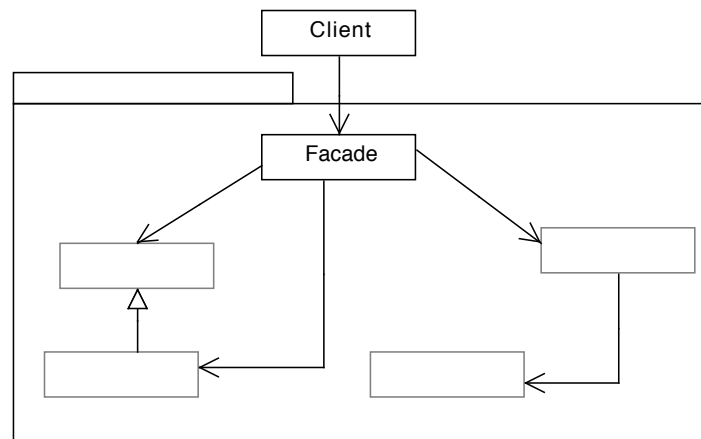

Facade

- Context
 - ♦ A functionality is provided by a complex group of classes (interfaces, associations, etc.)
- Problem
 - ♦ How is it possible to use the classes without being exposed to the details

56

56

Facade

57

57

Behavioral patterns

- Behavioral patterns are concerned with algorithms and the assignment of responsibilities between objects.
- Not just patterns of objects or classes but also the patterns of communication.
 - ♦ Complex control flow that's difficult to follow at run-time.
 - ♦ Shift focus away from flow of control to let concentrate just on the way objects are interconnected.

58

58

GoF behavioral patterns

Object-level

- ♦ Chain of Responsibility
- ♦ Command
- ♦ Iterator
- ♦ Mediator
- ♦ Memento
- ♦ Observer
- ♦ State
- ♦ Strategy
- ♦ Visitor

Class-level

- ♦ Template Method
- ♦ Interpreter

59

59

Mechanisms

- Encapsulating variation
- Objects as arguments
- Information circulation policies
- Sender and Receiver decoupling

60

60

Encapsulating Variation

- A varying aspect of a program
- Captured by an object
 - ♦ Other delegate operations to the “variant” object

61

61

Argument Objects

- Often an object is passed as argument
 - ♦ Hides complexity from clients
 - ♦ Concentrate the “active” code in one class

62

62

Information circulation

- Responsibility of how to circulate information may be:
 - ♦ Distributed among different parties.
 - ♦ Encapsulated in a single object.

63

63

Communication decoupling

- Decoupling senders and receivers is a key to:
 - ♦ Reduce coupling
 - ♦ Improve reusability
 - ♦ Enforce layering and structure

64

64

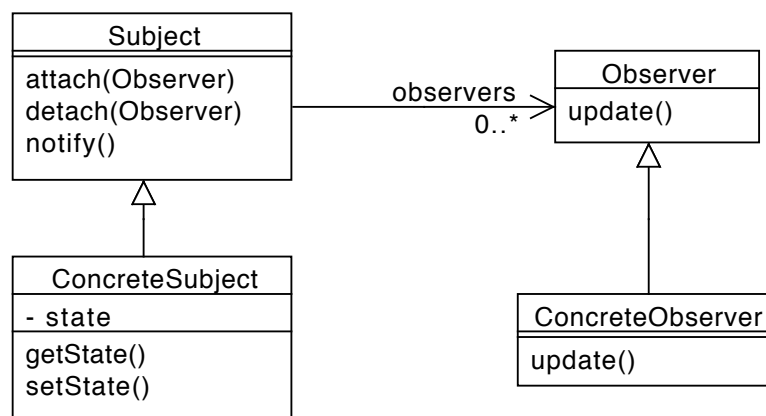

Observer

- Context:
 - ♦ The change in one object may influence one or more other objects
- Problem
 - ♦ High coupling
 - ♦ Number and type of objects to be notified may not be known in advance

65

65

Observer

66

66

Observer – Consequences

- + Abstract coupling between Subject and Observer
 - + Support for broadcast communication
 - Unanticipated updates
-

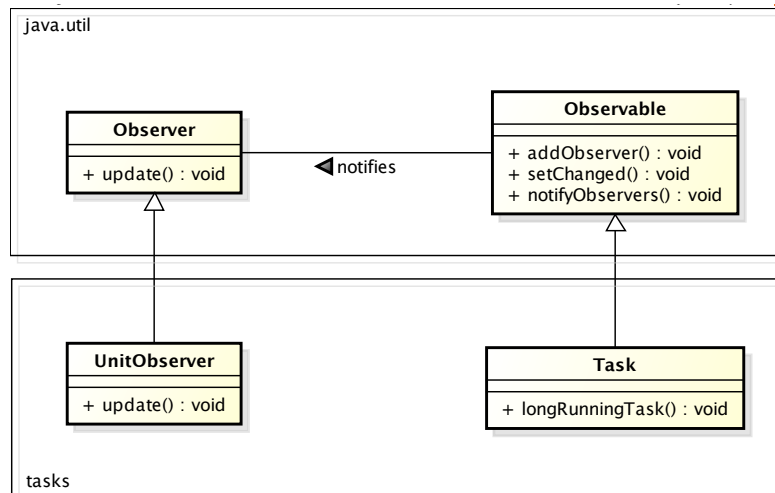

67

Observer–Observable

- Allow a standardized interaction between an objects that needs to notify one or more other objects
 - Defined in package `java.util`
 - Class **Observable**
 - Interface **Observer**
-

68

Observer–Observable

69

Java Observer–Observable

```
class Observable{
    void addObserver(..){}
    void deleteObserver(..){}
    void deleteObservers(){ }
    int countObservers() { }
    void setChanged() { }
    void clearChanged() { }
    boolean hasChanged() { }
    void notifyObservers() { }
    void notifyObservers(..) { }
}
```

70

70

Observer–Observable

- Class **Observable** manages:
 - ♦ registration of interested observers by means of method **addObserver ()**
 - ♦ sending the notification of the status change to the observer(s) together with additional information concerning the status (event object).
 - Interface **Observer** allows:
 - ♦ Receiving standardized notification of the observer change of state through method **update ()** accepts two arguments:
 - Observable object that originated the notification
 - additional information (the event object)
-

71

Observer–Observable

- Sending a notification from an observable element involves two steps:
 - ♦ record the fact the the status of the Observable has changed, by means of method **setChanged ()**,
 - ♦ send the actual notification while providing the additional information (the event object), by means of method **notifyObservers ()**
-

72

Inheritance vs. composition

Reuse can be achieved via:

- **Inheritance**

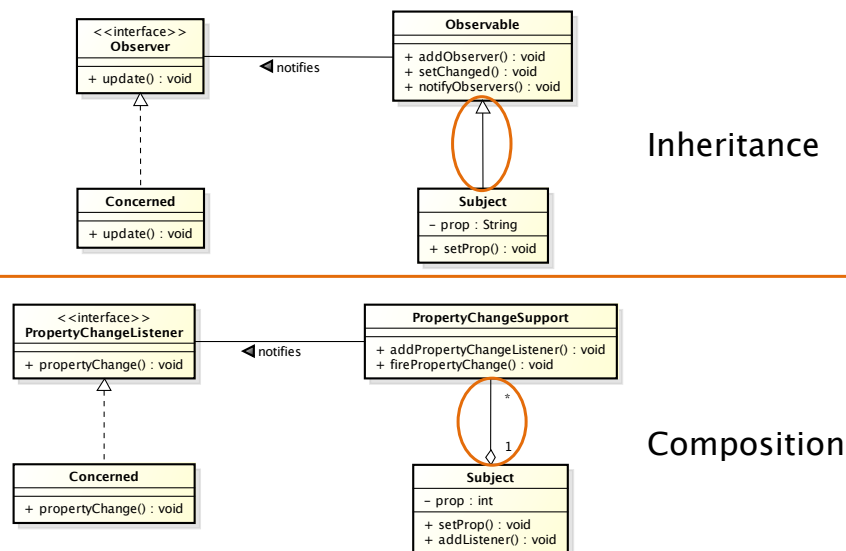

- ♦ The reusing class has the reused methods available as own methods.
- ♦ Clients can invoke directly inherited methods

- **Composition**

- ♦ The reusing class has the reused methods available in an included object (attribute)
- ♦ The reusing class must provide methods that accept clients requests and delegate to the included object

73

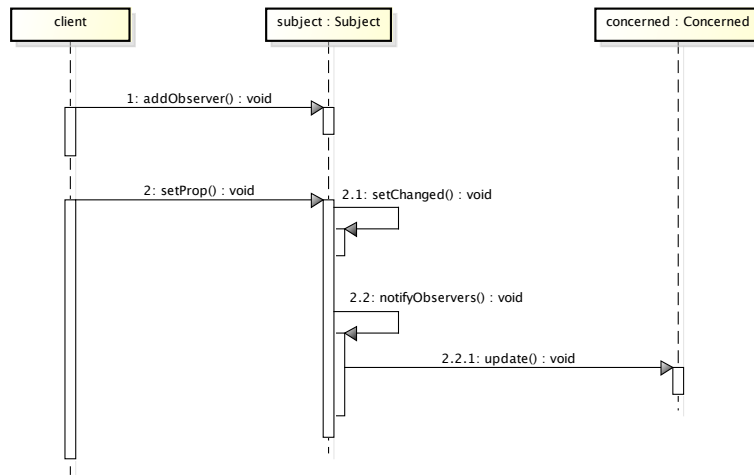

Inheritance vs. Composition

74

74

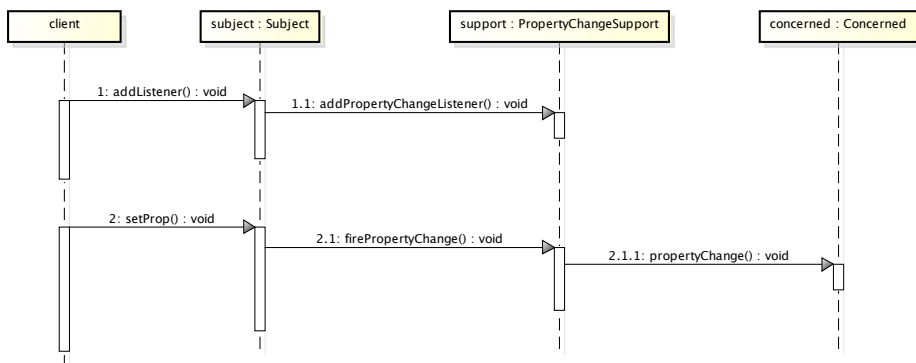

Observer w/Inheritance

75

75

Observer w/Composition

76

76

Observer subject w/inheritance

```
public class Subject
    extends Observable {

    String prop="ini";

    public void setProp(String val){
        setChanged();
        property = val;
        notifyObservers("theProp");
    }

}
```

77

77

Observer subject w/composition

```
public class Subject {
    PropertyChangeSupport pcs =
        new PropertyChangeSupport(this);
    String prop="ini";

    public void setProp(String val) {
        String old = property;
        property = val;
        pcs.firePropertyChange("theProp",old,val);
    }
    // delegation:
    public void addObs(PropertyChangeListener l){
        pcs.addPropertyChangeListener("theProp",l);
    }
}
```

78

78

Observer with inheritance

```
public class Concerned
    implements Observer {

    @Override
    public void update(Observable src,
                      Object arg) {
        System.out.println("Variation of " +
                           arg);
    }
}
```

79

79

Observer with composition

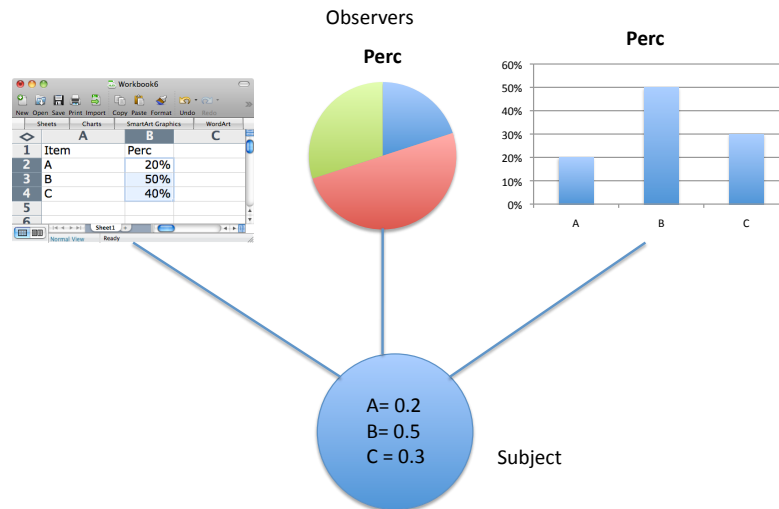

```
public class Concerned
    implements PropertyChangeListener {

    @Override
    public void propertyChange(
        PropertyChangeEvent evt) {
        System.out.println("Variation of " +
                           evt.getPropertyName());
    }
}
```

80

80

Observer Example

81

81

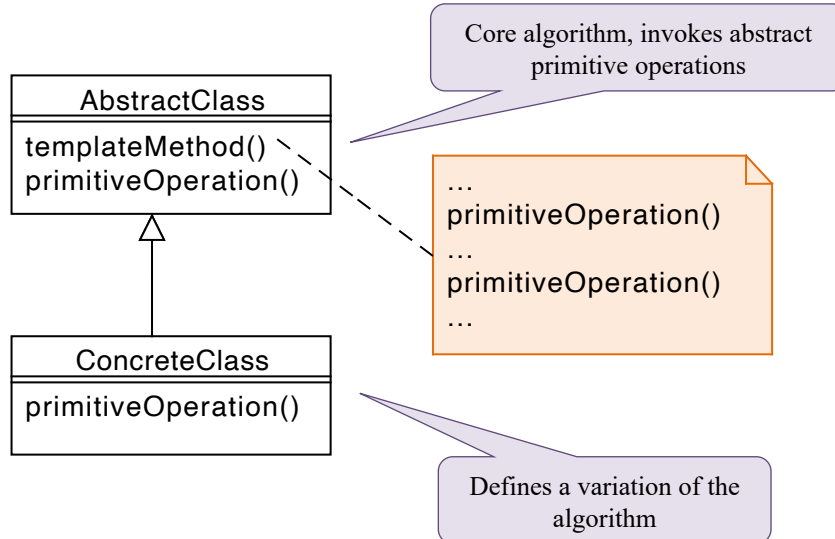

Template Method

- Context:
 - ♦ An algorithm/behavior has a stable core and several variation at given points
- Problem
 - ♦ You have to implement/maintain several almost identical pieces of code

82

82

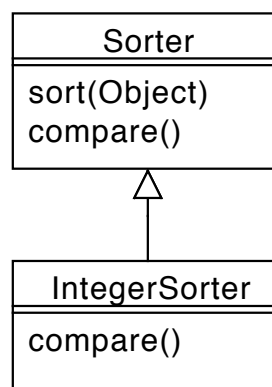

Template Method

83

83

Template Method Example

84

84

Example: Sorter

```
public abstract class Sorter {
    public void sort(Object v[]){
        for(int i=1; i<v.length; ++i)
            for(int j=0; j<v.length-i; ++j){
                if(compare(v[j],v[j+1])>0){
                    Object o=v[j];
                    v[j]=v[j+1]; v[j+1]=o;
                } } }
    }
    abstract int compare(Object a, Object b);
}
```

85

85

Example: StringSorter

```
class StringSorter extends Sorter {
    int compare(Object a, Object b){
        String sa=(String)a;
        String sb=(String)b;
        return sa.compareTo(sb);
    }
}
```

```
Sorter ssrt = new StringSorter();
String[] v={"g","t","h","n","j","k"};
ssrt.sort(v);
```

86

86

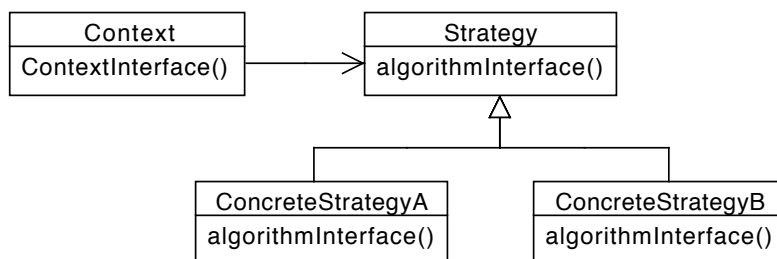

Strategy

- Context
 - ♦ Many classes or algorithm has a stable core and several behavioral variations
- Problem
 - ♦ Several different implementations are needed.
 - ♦ Multiple conditional constructs tangle the code.

87

87

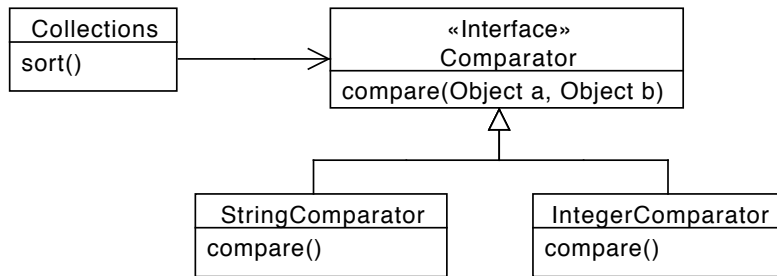

Strategy

88

88

Strategy example: Comparator

89

89

Comparator

- Interface `java.util.Comparator`

```
public interface Comparator<T>{
    int compare(T a, T b);
}
```

- Semantics (as comparable): returns
 - ♦ a negative integer if **a** precedes **b**
 - ♦ 0, if **a** equals **b**
 - ♦ a positive integer if **a** succeeds **b**

90

90

Comparator

```
class StudentCmp
    implements Comparator<Student>{
public int compare(Student a,Student b){
    return a.id - b.id;
    }
}
```

```
Student[] sv = { new Student(11),
                  new Student(3),
                  new Student(7) };
Arrays.sort(sv, new StudentCmp());
```

91

91

Strategy Consequences

- + Avoid conditional statements
- + Algorithms may be organized in families
- + Choice of implementations
- + Run-time binding
- Clients must be aware of different strategies
- Communication overhead
- Increased number of objects

92

92

Iterator pattern

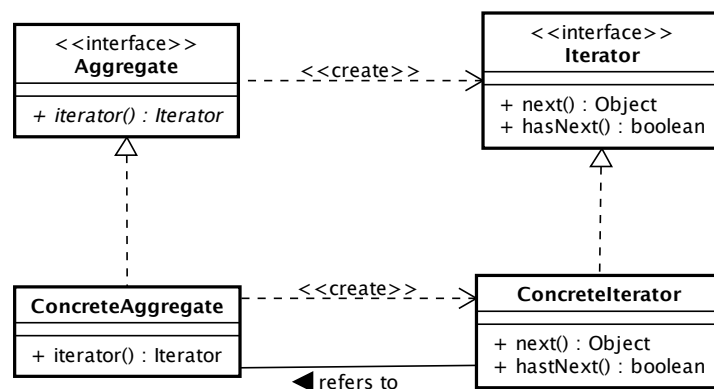

- Context
 - ♦ A collection of objects must be iterated
- Problem
 - ♦ Multiple concurrent iterations are possible
 - ♦ The internal storage must not be exposed
- Solution
 - ♦ Provide an iterator object, attached to the collection, that can be advanced independently

93

93

Iterator pattern

94

94

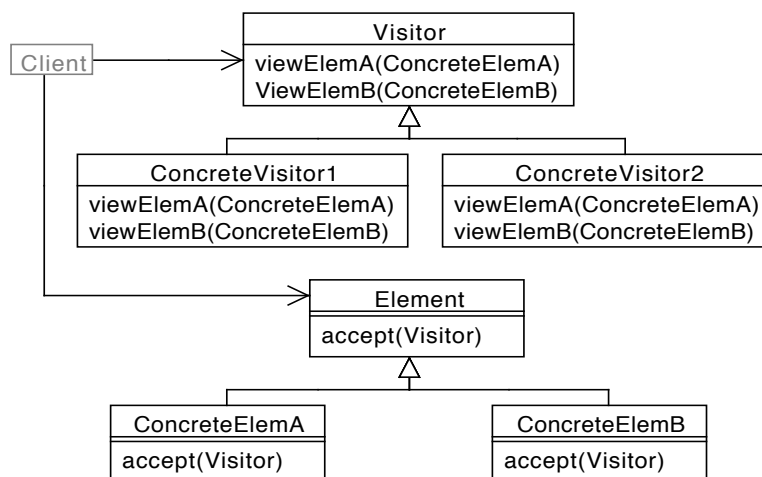

Visitor

- Context
 - ♦ An object structure contains many classes with differing interfaces.
 - ♦ Many different operations need to be performed on the objects
- Problem
 - ♦ The operations on the objects depend on their concrete classes
 - ♦ Classes could be polluted with several operations

95

95

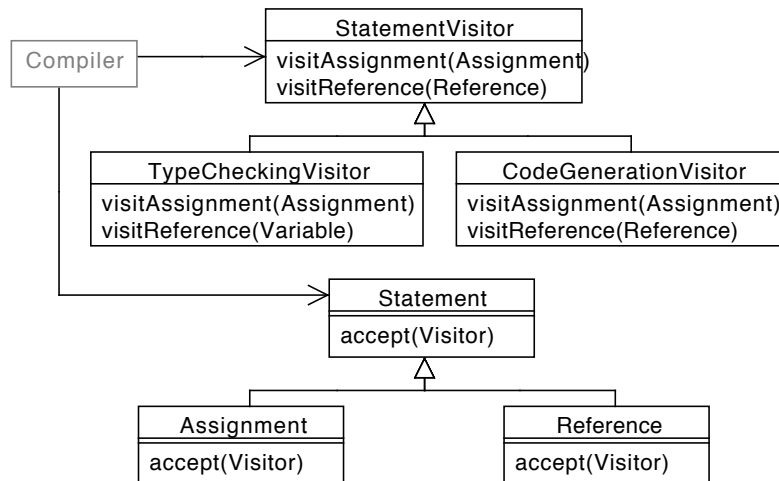

Visitor

96

96

Visitor Example

97

97

Visitor Consequences

- + Adding new operations is very easy
- + Behavior is partitioned
- + Can visit class hierarchies
- + State can be accumulated
- Difficult to add new concrete elements
- Break of encapsulation

98
